1. (24 points) The following problems are not related. If a limit does not exist, you must say so. If you use a theorem, clearly state its name and show that its hypotheses are satisfied.

(Reminder: You may not use L'Hôpital's Rule or "Dominance of Powers" in any solutions on this exam.)

(a)
$$\lim_{x \neq 0} \frac{\sec x}{4x \cot 2x}$$

(b)
$$\lim_{x \neq 7} \frac{\sin^2 x}{x}$$

(c)
$$\lim_{x \neq 1} \frac{x}{2} \frac{1}{5} \frac{x^2}{x^2}$$

Solution:

(a)

$$\lim_{x \neq 0} \frac{\sec x}{4x \cot 2x} = \lim_{x \neq 0} \frac{1 = \cos x}{4x \frac{\cos 2x}{\sin 2x}}$$
$$= \lim_{x \neq 0} \frac{\sin 2x}{4x \cos x \cos 2x}$$
$$= \lim_{x \neq 0} \frac{2 \sin x}{4x \cos 2x}$$
$$= \frac{1}{2} \lim_{x \neq 0} \frac{\sin x}{x} = \frac{1}{\cos 2x}$$
$$= \frac{1}{2}$$

(b) Note that

$$0 \quad \sin^2 x \quad 1 = 0 \quad \frac{\sin^2 x}{x} \quad \frac{1}{x}$$

and

$$0 = \lim_{x \neq 1} 0 = \lim_{x \neq 1} \frac{1}{x}$$

By the Squeeze Theorem, we conclude that

$$\lim_{x! \to 7} \frac{\sin^2 x}{x} = 0$$

(C)

$$\lim_{x/1} \frac{x}{2} \frac{1}{\sqrt{5}} = \lim_{x/1} \frac{(x-1)(2+\sqrt{5})}{(2\sqrt{5})(2+\sqrt{5})(2+\sqrt{5})}$$
$$= \lim_{x/1} \frac{(x-1)(2+\sqrt{5})(2+\sqrt{5})}{\sqrt{5}}$$
$$= \lim_{x/1} \frac{2+\sqrt{5})(2+\sqrt{5})}{\sqrt{5}}$$
$$= \lim_{x/1} \frac{2+\sqrt{5})(2+\sqrt{5})}{\sqrt{5}}$$
$$= \frac{2+2}{2}$$
$$= 2:$$

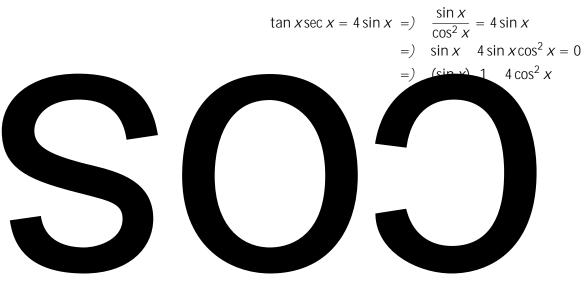

- 2. (21 points) The following problems are unrelated.
 - (a) Given that $\csc = \frac{p_{\overline{5}}}{5}$ and = 2 < < , find the values of tan and $\cos(2)$.
 - (b) Find all values of x in the interval [0;] that satisfy $\tan x \sec x = 4 \sin x$.
 - (c) A squirrel is up a tree, and it sees a peanut on the ground some distance away. If the straight-line distance between the peanut and the squirrel is 50 ft, and the angle between the straight-line and the tree is =6 radians, how far down the tree and across the ground must the squirrel travel to reach the peanut? *Give your answer with appropriate units.*

Solution:

(a) Since $\csc = {}^{\mathcal{D}}\overline{5}$, we know that $\sin = \frac{1}{\sqrt{5}}$. Thus, the angle is opposite a side of length 1 in a right triangle with hypotenuse ${}^{\mathcal{D}}\overline{5}$. The adjacent side to has length $({}^{\mathcal{D}}\overline{5})^2 - 1^2 = 2$. Hence, $\tan = \frac{1}{2}$. Using a double-angle identity for cosine, we know that

$$\cos 2 = 1$$
 $2\sin^2 = 1$ 2 $1 = \frac{1}{5} = \frac{2}{5} = 1$ $\frac{2}{5} = \frac{3}{5}$

(b) Note that

- (a) Find a formula for f(x).
- (b) Sketch a graph of y = jf(x)j + 1

(b) Note that we can cancel the $(x \ 4)$ factor in the numerator and denominator of g(x), so

$$g(x) = \frac{2(x-2)}{x-3}$$

for all x except x = 4. Then

$$\lim_{x \neq 4} g(x) = \lim_{x \neq 4} \frac{2(x-2)}{x-3} = \frac{2(4-2)}{4-3} = 4$$

which shows that x = 4 is a removable discontinuity for g(x). Also, x = 3 is an infinite discontinuity (or a vertical asymptote) for g(x) because

$$\lim_{x/3^{+}} g(x) = \lim_{x/3^{+}} \frac{2(x-2)}{x-3} = \frac{2}{\lim_{x\to 3^{+}} (x-3)} = 7$$

(C)

$$\lim_{x \neq 1} \frac{2x^2}{x^2} \frac{12x + 16}{7x + 12} = \lim_{x \neq 1} \frac{x^2(2 - 12 = x - 16 = x^2)}{x^2(1 - 7 = x + 12 = x^2)}$$
$$= \lim_{x \neq 1} \frac{2 - 12 = x - 16 = x^2}{1 - 7 = x + 12 = x^2}$$
$$= \frac{2 - 0 + 0}{1 - 0 + 0}$$
$$= 2:$$

By a similar argument, $\lim_{x \neq 1} g(x) = 2$.

5. (10 points) Consider the function

$$f(x) = \begin{cases} b\cos(x); & x = 1 \\ 3 p \frac{2x - 2}{2x - 2}; & x > 1 \end{cases}$$

Find the value of *b* such that $\lim_{x \neq 1} f(x)$ exists. Justify your answer by calculating appropriate limits. **Solution:** Note that

$$\lim_{x/1^{+}} f(x) = \lim_{x/1^{+}} (3 \frac{p}{2x-2})$$
$$= 3 \frac{p}{2(1)-2}$$
$$= 3;$$

So we need

$$3 = \lim_{x \le 1} b\cos(x) = b\cos(x) = b$$

for $\lim_{x \neq 1} f(x)$ to exist. Hence, choosing b = 3 guarantees that the two-sided limit of f(x) at exists, in which case it equals 3.

6. (10 points) Show that the equation $x = \sin x \cos x$ has at least one real solution. Indicate the interval where a solution can be found.

Solution: Let f(x) = x 2 sin $x \cos x$. Then the given equation has a solution where f(x) = 0. Note that f(x) is continuous because sin $x \cos x$ is the product of continuous functions, which is continuous, and x 2 is

continuous because it's a polynomial. Then f(x) is given by the difference of two continuous functions, and hence is continuous itself.

Also, f(0) = 2 < 0, and f() = 2 > 0. Since *f* is continuous everywhere, in particular on [0,2], the Intermediate Value Theorem guarantees that f(x) = 0 has a solution in the interval (0,2), and the given equation does as well.
